

Work Station Equipment

This section contains those articles which are permanently installed on the tubing system in the work station. These are the closure devices required at every work station such as flap valves and shutter valves but also fume arms, Flexpipes, swing-

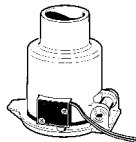

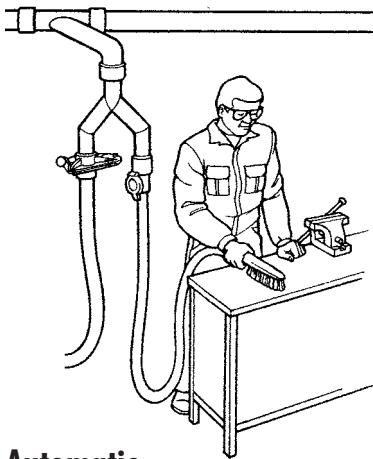

arms, hose reels, etc. Closing every outlet is required to limit the capacity requirement of the central unit.

Closure at the work station can be manual, such as a flap valve, or automatically controlled for opening only when required. Flexpipes,

swing-arms and hose reels are used to increase the working envelope while avoiding the use of longer hoses.

The stainless funnel is used for the dumping of coarse waste.
